

Technology quarterly and proceedings of the Society of Arts Volume 4

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1891 Excerpt: ...to form the tissues and organs of the embryo. Now of these cells in the embryo Weismann distinguishes two different kinds; viz., the germ cells, which lie in the generative glands of the animal, and the somatic cells, which form all other organs and the body itself. During early youth the germ cells remain dormant. When, however, adult life is reached, they develop, and under proper conditions, such as fertilization, etc., each one is capable of producing a new organism, with germ cells and body, while the body itself grows old and dies. The germ cells of the second generation do not die, but produce a third, and the third a fourth generation, and so on. The body of each of these generations must grow old and die, but the germ cells themselves, if allowed the proper physical surroundings, do not. They go on germinating, and so produce generation after generation. Hence it would appear that the germ cells of the higher organisms are exactly parallel to the entire body of the lower forms, and like them are endowed with potential immortality, and that this immortality has never been broken by death since life first existed on this earth. In other words a Metazoon equals a colony of Protozoa plus a perishable body. Death, then, is something secondary; an adaptation which has been acquired during the evolution of the mortal, from the lowly immortal forms. Weismann suggests that this adaptation of death has been brought about in the following manner, by what he terms panmixia, or the cessation of natural selection. It is generally admitted that congenital variation in the size and form of every organ or part occurs constantly, and further that such variation is liable to be inherited; also that species are formed and

maintained by natural selection preserving the...
