

High Jet Multiplicity Physics at the Lhc (Springer Theses)

This book describes research in two different areas of state-of-the-art Hadron Collider physics, both of which are of central importance in the field of particle physics. The first part of the book focuses on the search for supersymmetric particles called gluinos. The book subsequently presents a set of precision measurements of multi-jet collision events. Now that a Higgs boson has been discovered at the Large Hadron Collider, the existence (or non-existence) of these as-yet-unobserved particles is of the utmost interest and significance, both theoretically and experimentally. Such collisions, which involve large numbers of newly created particles, are among the dominant processes at the Large Hadron Collider. These types of collision are an important background process for a wide range of analyses, including searches for supersymmetry.
