

Progress in Drug Research (Progress in Drug Research/Fortschritte Der Arzneimittelforschung)

Volume 37 of Progress in Drug Research contains seven articles and the various indexes which facilitate its use and establish the connection with the previous volumes. While all articles deal with some of the topical aspects of drug research, the contribution by Alfred Burger on Isosterism and bioisosterism in drug design is of great value to those researchers who are engaged in drug design and wish to include isosteric considerations in establishing a working hypothesis. The remaining six reviews provide an overview of the work involved in the search for new and better medicines. All these articles contain surveys of the latest findings in the respective domain. In the 31 years this series has existed, the Editor has enjoyed the help and advice of many colleagues. Readers, the authors of the individual reviews and, last but not least, the reviewers have all contributed greatly to the success of PDR. Although many comments received have been favorable, it is nevertheless also necessary to analyze and to reconsider the current position and the direction of such a series.
